Welcome

This book has been thoughtfully created for you, the care partner. Caring for an individual with this disease is not intuitive. Being a care partner can be challenging and overwhelming at times. This guide is meant to serve as a road map to help you navigate those challenges and anticipate changing needs so that you can recognize and appreciate the moments of joy.

Throughout this book we refer to you as a care partner. We acknowledge that individuals with dementia can require a great deal of care and our hope is that partnering with them to ensure they are getting the appropriate level of care fosters their independence and allows them to live a life with dignity.

We hope that you find this publication helpful and know that the Hartford HealthCare Center for Healthy Aging is here to partner with you.
# Table of contents

**Chapter 1: Introduction to Dementia**
- What is dementia?  
  - 6
- Why get a diagnosis?  
  - 8
- How can I find out if I have dementia?  
  - 9
- The healthy brain  
  - 10
- What happens to the brain with dementia?  
  - 11
- Symptoms and stages of dementia  
  - 11
- The brain – normal functioning and impaired functioning with dementia  
  - 12

**Chapter 2: Younger Onset Dementia**
- Why get a diagnosis  
  - 14
- Work and younger onset dementia  
  - 15
- What about social supports?  
  - 15
- Strategies for couples  
  - 17
- Strategies for children  
  - 17
- What can you do?  
  - 17

**Chapter 3: Communication**
- The basics of good communication  
  - 19
- Ensuring a positive connection  
  - 20
- Creative communication techniques  
  - 20
- How to complete a care task  
  - 21
- Communication through the stages of dementia  
  - 23
- Ten Tips for effective communication with a person with dementia  
  - 26
Chapter 4: Understanding Behaviors Related to Dementia

Understanding behaviors (the way people behave or act) 28
What behaviors can be linked to dementia? 29
Managing personality and behavior problems 30
Five common behaviors that occur with dementia and what to do 31
Inappropriate sexual behavior 32
Responding to a challenging behavior 33
Catastrophic reaction 34
How can a catastrophic reaction be prevented? 35
Wandering 36
Basic human needs and the language of behavior 38

Chapter 5: Safety

General safety concerns for people with dementia 40
Safety in the physical environment 40
Home Safety room to room 43
Is it safe to leave the person with dementia home alone? 47
Driving safety 47

Chapter 6: Activities

Benefits of activities 51
Tips to help make an activity successful for the individual with dementia 52
Planning the day 53
Writing the plan 53
Activities to do with an individual who has dementia 54

Chapter 7: Care Options

Care options 56
Choosing a care facility 57
Care facility checklist 58
How you can partner with rehabilitation 59
Emergency planning for the “What Ifs” 60
Chapter 8: I’m a Care Partner, now what?
Care partner qualities 62
The traits to be a good dementia care partner 63
How to partner with your healthcare providers 64
“Introduction to my life” tool 65
Positive approaches to being a care partner 68
Grief cycle in being a dementia care partner 69
Ways to stop guilt from dementia care 70
Normal feelings and concerns care partners have that lead to feelings of guilt 71
Ten real-life strategies for a dementia care partner 71
Ten signs of care partner stress 75
Tips for coping/managing stress as a care partner 76

Chapter 9: Legal and Financial Concerns
Plan ahead: legal and money concerns 78
Overview of medical, legal, and financial planning documents 78

Appendix and Glossary
Books to help caregivers understand Alzheimer’s and related dementias 81
Books to help children understand Alzheimer’s and related dementias 82
Dementia Internet Resources 83
CHAPTER 1

Introduction to Dementia
What is dementia?
Dementia isn’t a specific disease. Dementia is a medical condition that interferes with the way the brain works. Dementia describes a group of symptoms affecting memory, thinking and social abilities severely enough to interfere with daily functioning.

Symptoms
1. Memory loss
2. Changes in how people talk
3. Changes in how people act
4. Trouble completing day to day activities
5. Difficulty learning new skills

Most common types of dementia
The brain tissue shrinks throughout the disease process which causes the memory decline.

Alzheimer’s disease, often abbreviated AD. Alzheimer’s Disease is the most common: progresses slowly; and gradually destroys memory, reason, judgment, language, and eventually the ability to carry out even simple tasks. People with Alzheimer’s disease have a lot of abnormal structures called plaques and tangles in the brain.

- Plaque is a deposit of a type of protein fragment that builds up in spaces between nerve cells.
- Tangles are twisted fibers of another type of protein that build up inside nerve cells.
• The buildup of these two proteins causes a loss of connections between brain cells. This damage and loss of nerve cells causes memory loss, personality changes, speech and language problems.

The brain tissue shrinks throughout the disease process which causes the memory decline.

At this time, scientists know that Alzheimer’s disease involves a failure of nerve cells, but they still don’t know why this happens. Scientists have been able to identify certain risk factors such as age, family history, and genetics that increase the likelihood of developing Alzheimer’s.

**Vascular dementia**, often abbreviated VaD. Vascular dementia is caused by conditions that block or reduce blood flow to different areas of the brain. This causes the brain to get less oxygen and nutrients. It often presents as general confusion, agitation, poor judgment, problems with reasoning, and changes in behaviors. Heart disease, stroke, diabetes, high blood pressure, high cholesterol and smoking increase the risk for vascular dementia.

**Acquired brain injury**, often abbreviated ABI is caused when there is some type of injury or lack of oxygen to the brain. Dementia-related symptoms in brain injury often affect thinking, ability to concentrate, memory, communication, personality, mood, behaviors and interactions with others.

**Fronto-temporal dementia**, often abbreviated FTD. Frontotemporal Dementia is caused by a group of disorders that occur when nerve cells in the frontal and temporal lobes of the brain are lost. This causes the lobes to shrink. It often presents as changes in behavior, personality, language (speech), poor planning and judgment and certain types of movement.

**Dementia with Lewy Body**, often abbreviated LBD. Lewy body dementia is caused by abnormal deposits of a protein in the brain. It often presents as hallucinations, apathy (loss of motivation, interest, and concern), movement disorders and changes in sleep patterns. It leads to a decline in thinking, reasoning and motor skills.

**Wernicke- Korsakoff Syndrome**, often abbreviated WKS. Wernicke-Korsakoff Syndrome is a brain disorder caused by a lack of vitamin b1 or thiamine, long term alcohol abuse can increase the chance of this diagnosis. It often presents with confusion, changes in eyes and vision and creative storytelling.
Cretzfeldt-Jacob disease, often abbreviated CJD, and referred to as Mad Cow Disease. Creutzfeldt-Jakob Disease destroys brain cells creating sponge-like holes or lesions in the brain. It often presents with difficulty controlling body movements such as sudden jerky movements, difficulty speaking, insomnia, vision changes, memory loss, impaired thinking.

Parkinson’s disease dementia, often abbreviated as PDD. The cause of Parkinson’s Disease Dementia is currently unclear. It often presents as memory loss, difficulty concentrating, loss of decision making ability, disorientation to familiar surroundings, trouble with speaking and understanding complex language. It’s important to know that not all people with Parkinson’s Disease get dementia.

Mixed Dementia, this is a combination of two types of dementia. The most common combination is Alzheimer’s disease and vascular dementia. The second most common is Alzheimer’s disease and Lewy body.

Chronic Traumatic Encephalopathy, often abbreviated as CTE. The greatest risk factor for Chronic Traumatic Encephalopathy is repetitive brain trauma. Repeated blows to the head in sports, frequent concussions, uncontrolled epilepsy or physical attacks to the head. This disease causes brain damage and common symptoms are short-term memory loss, confusion, change in personality, unpredictable impulsive behavior, and difficulty with balance and motor skills.

Treatment
At this time there is no cure for dementia, however there are treatments to help manage symptoms.

Why get a diagnosis?
Memory concerns are not always caused by a dementia. A doctor will determine what tests are needed to identify the reason for the memory issues. Whether there is a diagnosis of dementia or another medical condition, a treatment plan will be determined that is best for you.
Treatable conditions that may be causing your memory loss

<table>
<thead>
<tr>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Medication side effects</td>
</tr>
<tr>
<td>Thyroid, kidney or liver disorders</td>
</tr>
<tr>
<td>Vitamin B12 deficiency</td>
</tr>
<tr>
<td>Brain tumor</td>
</tr>
<tr>
<td>Depression</td>
</tr>
<tr>
<td>Lyme disease</td>
</tr>
<tr>
<td>Delirium</td>
</tr>
</tbody>
</table>

What are the advantages to an early diagnosis?

- A better chance of benefitting from treatment
- More time to plan for the future

If the diagnosis is a dementia, there are medical trials being held to reduce the cognitive deficits (memory, language, thinking, etc.), and an early diagnosis is needed to be part of research trials.

How can I find out if my loved one has dementia?

The first step is to make an appointment with their primary care provider for a physical exam and discuss the concerns and symptoms. Be sure to be there as their support person. This will help to make sure your questions and concerns are being addressed.
During the doctor’s visit talk about:

Health concerns
Discuss what brought you and your loved one to the doctor and any fears or concerns you may have.

Medications
Bring a list of all your medications from the doctor and all over-the-counter medications.

What to expect at your doctor appointment
• Physical exam
• Blood and urine tests
• Neurological exam
• Cognitive exam
• Referral to specialist (neurologist, neuropsychologist, geriatrician, geriatric psychiatrist)

The healthy brain
• Takes in Information
• Stores Information
• Processes Information
• Retrieves Information

When a person has dementia, the brain changes and these tasks become more difficult.
## What happens to the brain with a dementia?
### Symptoms and Stages of Dementia

<table>
<thead>
<tr>
<th>Ability Affected</th>
<th>Early Stage</th>
<th>Middle Stage</th>
<th>Late Stage</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Memory</strong></td>
<td>Has trouble with remembering recent events; may have difficulty remembering names, finding the right word, and remembering thoughts; misplaced familiar items, may forget appointments, or get lost during a trip to a familiar place</td>
<td>Is largely unaware of all recent events and experiences; can still remember distant past; cannot form new memories; forgetfulness of events or about one’s own personal history; unable to remember their own address or telephone number</td>
<td>Has no recent or past memory</td>
</tr>
<tr>
<td><strong>Cognitive Ability</strong></td>
<td>Has difficulty handling finances; having greater difficulty performing tasks in social or work settings; may have difficulty telling time; may no longer be capable of working; increasing trouble with planning or organizing</td>
<td>Has great difficulty making decisions and choices; has difficulty concentrating and easily loses flow of conversation; needs one-step instruction to complete tasks</td>
<td>Has little noticeable cognitive function; shows poor judgment; loses sense of time and place</td>
</tr>
<tr>
<td><strong>Motor Skills</strong></td>
<td>Still has generally good coordination and motor skills; may have slowed reaction time</td>
<td>Loses coordination and balance; may be unsteady; bump into things and fall easily; may have difficulty walking; loses ability to write legibly; trouble controlling bladder and bowels sometimes</td>
<td>Usually loses ability to walk and sit up; may lose ability to swallow</td>
</tr>
<tr>
<td><strong>Mood and Behavior</strong></td>
<td>May experience mood swings; socially withdrawn; easily distracted; seeks out and prefers familiar; less spontaneous; less initiative; may deny forgetfulness and confusion</td>
<td>Experiences frequent mood swings; is increasingly self-absorbed; insensitive to feelings of others; may suffer sleep problems; personality and behavioral changes, including being suspicious and delusions or compulsive actions</td>
<td>Is often agitated; may not recognize primary caregiver; lose awareness of recent experiences as well as of their surroundings</td>
</tr>
<tr>
<td><strong>Ability to complete personal care</strong></td>
<td>Carries out personal care with little or no assistance</td>
<td>Needs assistance with personal care, for help choosing proper clothing for the season or the occasion and putting on clothing properly; may have fear of bathing; may have difficulty with toileting</td>
<td>Needs extensive assistance with personal care; bathing, grooming, dressing, and feeding</td>
</tr>
<tr>
<td><strong>Language</strong></td>
<td>May communicate less, but speech is generally unaffected; has slightly reduced vocabulary; has problems coming up with the right word or name; is occasionally vague; may say irrelevant things</td>
<td>Talk less or may repeat words or phrases continuously; has slower speech filled with pauses and interruptions; uses complete sentences infrequently; may make little sense; has significantly reduced vocabulary; may lose ability to understand written and/or spoken language; may invent words; must have instructions repeated</td>
<td>May lose ability to speak altogether or vocabulary may be limited to one or two words; may be able to repeat words or phrases without understanding meaning; may repeat words continuously; may be unable to understand what is being said</td>
</tr>
</tbody>
</table>
The brain – normal functioning and impaired functioning with dementia

Each part of the brain has a function and depending on where the dementia is located in the brain different challenges will occur. The person with dementia will have impaired functioning and the care partner must learn new ways of responding to help the person be successful day to day. Below is a table showing the normal and impaired functioning of the brain and interventions to use based on the part of the brain that is affected.

<table>
<thead>
<tr>
<th>Part of the Brain</th>
<th>Normal Functioning</th>
<th>Impaired Functioning</th>
<th>Interventions</th>
</tr>
</thead>
</table>
| Hippocampus       | Involved in storing recent memories  
Sensory information is received and placed into storage for later retrieval | Unable to store new information  
Gets lost easily  
Repeats questions  
Is confused  
No sense of time  
Loses possessions | Provide eye contact and cheerful body language  
Validate feelings  
Answer questions as if they were heard for the first time  
Redirect to non-confusing activities |
| Frontal Lobe      | Involved in planning, decision making and purposeful behavior  
Personality, judgment, attention span  
Regulates mood  
Controls impulses and social appropriateness | Cannot plan, initiate or carry out complex activities  
Problems with new situations  
Easily distracted  
Personality changes common | Give step by step directions one at a time  
Give prompts, visual cues to start an activity  
Keep environment safe  
Reduce environmental stimuli and noise levels |
| Occipital Lobe    | Receives and processes visual information from the eyes  
Analyzes visual information for orientation, position, and movement | Unable to process rapid body movements  
Loses sense for 3-dimensional space  
Loses peripheral vision | Always approach from the front  
Avoid patterned floor and wall designs  
Assist with slow and deliberate movements |
| Temporal Lobe     | Responsible for perception  
Processes language and ability to speak and understand language  
Puts together the parts to make sense | Develops aphasia - a speech impairment resulting in an inability to make oneself understood or to understand others  
Examples: word loss, disorganized sentences, make up answers to cover up word deficit | Early on – fill in missing words  
Later on – prompt with gestures body language, hand-on-hand or physical prompts  
Use positive body language |
| Parietal Lobe     | Sensory perceptual part of the brain  
Processes sensations such as pain, touch, heat  
Words put together into thoughts | Develops agnosia - cannot make sense of the senses, misidentifies familiar objects, and does not understand their purpose  
Cannot follow auditory and visual cues | Assist with prompts, gestures, demonstration and body language  
Give prompts that help clarify the purpose or goal of an object |
CHAPTER 2

Younger Onset Dementia
Younger Onset Dementia is a term used for people who develop dementia under the age of 65. Many of these people have symptoms in their 40s and 50s. Alzheimer’s disease and Frontotemporal dementia are thought to be the most common forms of dementia for people with younger onset at this time.

The symptoms of dementia are not determined by a person’s age, but younger people often have different needs, and require some different support. It can be difficult to accept this diagnosis because many people relate dementia to older people. Since this diagnosis is given earlier in their life they are likely to be physically and socially active, which brings new challenges to their life.

**At the time of diagnosis they may be:**
- In full-time employment
- Actively raising a young family
- Caring for aging parents
- Financially responsible for a family
- Physically strong and healthy

**For these reasons people with younger-onset dementia may face unique challenges:**
- Stigmas and stereotypes about the disease
- Due to their young age, people may not believe they have the disease or question the diagnosis
- They may lose relationships or jobs because people don’t understand that dementia can affect young people
- Some people don’t understand that dementia is a medical illness
- Face new financial challenges related to steady income and ability to work

**Why get a diagnosis?**
Getting a diagnosis early is very important. It provides treatment options including the opportunity to participate in clinical trials. Medications can be provided to lessen the symptoms for a limited time as well as giving you more time to plan for the future. It helps the person identify personal health concerns that can help preserve cognitive function including lifestyle changes such as quitting smoking, blood pressure control, diabetic management, better sleep, increased physical activity, etc.
Work and younger onset dementia
Younger people with dementia are more likely to be employed at the time of diagnosis, have dependent children, be physically active and have financial commitments.

The care partner and the person with the disease may want to talk with their employers before the condition noticeably affects job performance and attendance.

Be aware of potential effects of discussing the diagnosis, consider consulting with an employment law attorney.

It is important to secure the benefits to which you are entitled.

Some things to consider when talking to the employer:
• Is early retirement an option?
• Is there another position available in the company that would be better suited for the evolving needs and limitations?
• What are you and your loved one’s benefits?
• Does the employer offer an Employee Assistance Program (EAP)? If so, this is a great place to start to discuss available options.
• What resources and benefits are available under Americans with Disabilities Act, Family and Medical Leave Act and COBRA?

People with younger onset dementia will eventually be unable to work and this loss of income is often a serious concern. A spousal care partner may also quit their job or decrease work hours, which increases financial strain. Consider talking to a financial advisor and/or a lawyer to help plan for future financial needs. An elder law attorney may be most familiar with the financial concerns related to a dementia diagnosis.

Everyone’s place of work is very different. Be mindful of risks associated with the type of work and assess if it is still safe to continue working.

It’s important not to make rash decisions that could affect one’s overall health and financial well-being. Educate yourself on options and access to employee benefits.

What about social supports?
Some medical benefits and many social-support programs in Connecticut don’t provide assistance unless the person with dementia is older than age 65. Younger people may need special waivers to get into these programs.
What can be done?

- Talk with a financial planner and an attorney to help plan for future financial needs
- Explore what benefits may be available through Social Security, Medicare or Medicaid
- Organize financial documents to manage your family’s finances
- Make a list of username and password information
- Complete Power of Attorney forms (financial and medical) as soon as the diagnosis is made to assist with planning as the disease progresses
- Develop an Advance Directive/Living Will
- Create a folder/personal health record that has a list of doctors, tests, important medical information and resources for the person with the dementia
- If a family member (adult or young child) is struggling to accept and understand younger onset dementia there is a list of books and videos available at the back of this guide
Strategies for couples
Moving from the romance of a relationship to a care partner changes and can complicate the relationship. There may be feelings of loneliness, grief and loss, not knowing what the future will bring can be stressful. It’s important to communicate with each other and discuss what kind of help you may need from each other don’t be afraid to ask for help. This is an unsettling diagnosis however it’s important to continue doing the many activities that you both enjoy together; you can also find new activities you both enjoy.

There may be different feelings or challenges around sex. It is ok to discuss this with the provider caring for your loved one with dementia. There are also counselors who work with couples on these issues and the changes in relationships.

Strategies for children
It may be hard for children to understand younger-onset dementia. They may be angry, think it is their fault, withdraw or misbehave at school. Consider sharing this diagnosis with the school social worker/ counselor, teacher or nurse, as children may exhibit changes, such as acting out or withdrawing at school or home. Everyone processes this diagnosis and disease progression differently, sometimes children benefit from discussing the diagnosis, supporting their needs to express concerns can help.

What can you do?
• Continue to spend time together and find things everyone can enjoy
• Keep yourselves involved in your children’s lives
• Be open and honest and talk with the children about what is happening
• Find a support group for your children (there are on-line or in-person support groups)
• If your children are struggling consider talking with a therapist/counselor
• Encourage your children to keep a journal and write down their thoughts
• Consider working with the person with the dementia to create audio or video records of thoughts or messages
CHAPTER 3

Communication
The basics of good communication

• Approach the person from the front
• Always make eye contact
• Identify yourself
• Call individual by name

Be aware of your communication style

• Use calm tone of voice
• Don’t speak too loudly or too softly
• Body language, including hand gestures, makes up 80% of how you communicate
• Avoid long explanations
• Speak slowly using simple words
• Avoid interrupting and arguing with them
• Avoid confrontation and remain calm
• Make positive suggestions instead of negative
  – Positive “Let’s go this way.”
  – Negative “Don’t go that way.”

Listen carefully

• Try to understand the person’s feelings and emotions
• It’s okay to acknowledge bad feelings as well as good ones
• Give plenty of encouragement and reassurance
Ensuring a positive connection
- Provide a calm and quiet environment
- Keep things simple
- Limit choices to no more than 2 things
- Avoid open-ended questions
- Read body language for pain, hunger, thirst, or need to use the bathroom
- Avoid arguing
- Allow the person their own reality- agree with them, validate their feelings, and try to reminisce or redirect them to another activity
- Sing or play soft music as this can bring a sense of calm
- Engage the person with an activity as this may replace anxious feelings with feelings of enjoyment

Creative communication techniques
Visual cues can jump start the brain to remember what to do. These can prompt the person to perform basic tasks.
Examples of visual cues
As the disease progresses, visual cues will need to be changed.

- Signage which can be written words or pictures. The written word can help remind what to do, such as “take medications” or “turn off the faucet.” Pictures can label the contents of a dresser drawer or kitchen cabinet
- Extra lighting or contrasting colors can highlight an area such as the toilet or a stairway
- Memory aids such as a calendar, a schedule of daily routine, a large button phone with pictures of important people, or timers can help
- Mirroring a task
  - For example: eating across from each other, helps start the task of eating

How to complete a care task

- Get the person’s attention by calling their name and making eye contact. If the person is lost in thought, direct his attention to you by gently touching his arm or his leg
- Tell the person what you want them to do. Use short sentences and simple phrases
  - “It’s time for your shower.”
  - “That shirt is dirty. Let’s get you a different shirt.”
- Encourage the person to participate in their own care as much as possible. Offer short, clear one-step instructions and give the person enough time to process what you are saying. Allow them time to complete the requested action before giving the next instruction
- Offer praise and reassurance as needed
What to do if the person says NO to care

Offer redirection. Change the subject or give the person something else to focus on such as old photos, playing favorite music or putting in a favorite DVD or movie.

Wait until the person is calm again, and then re-approach them with a positive attitude as if the previous conflict never happened

- For example: Don’t say, “Are you ready for dinner now?” Instead say, “Hi Dad, It’s time for dinner.”
- If the person continues to say no to care, ask yourself how important the issue really is. If it’s not that important – let it go for another day.
Communication through the stages of dementia

What to expect in the early stage
- They can make decisions about future care
- They can convey thoughts and feelings through language
- They may have difficulty finding the right words
- They may take longer to speak or respond
- They may withdraw from conversations

How to connect in the early stage
- Ask the person directly how to help with communication (i.e., fill in words)
- Keep sentences clear and straightforward
- Allow plenty of time for conversation
- Include the person in conversations that affect them (don’t whisper behind their back)
- Recognize the effects of your mood and actions on the person

What to expect in the middle stage
- They can still use basic words and sentences
- They rely more on tone of voice, facial expressions, and body language
- They continue to need emotional connections and meaningful activities
- They have increased difficulty finding the right words
- They may use familiar words repeatedly
- They may invent new words to describe familiar things
- They easily lose their train of thought
- They may speak less frequently
How to connect in the middle stage

• Approach the person from the front, say who you are, and call the person by name
• Maintain eye contact
• If seated, get at their eye level
• Avoid correcting and arguing
• Pay attention to your tone of voice
• Take your time
• Respond to the person’s feeling behind their statement
• Use short sentences and basic words
• Limit distractions
• Be patient
• Provide visual cues and gestures (signs, pictures, smiles)
• Avoid quizzing
• Focus on the feelings not the facts; validate feelings and redirect the person if necessary

For example the person says: “I want to go home.”
You say: “Tell me about your home.”
Or the person says: “I can’t find my purse.”
You say: “You look upset, let me help you look for the purse.”

Be aware that your mood and actions affect the person with memory loss.

What to expect in the late stage

• Communication is reduced to a few words or sounds
• May be able to respond to familiar words or phrases that they understand
How to connect in the late stage

- Use all 5 senses to communicate: touch, sight, sound, smell, and taste
- Understand and accept what you can and cannot change
- Help meet the needs while soothing and calming the person
- Use a gentle affectionate voice when talking
- Make the person feel safe and happy
- Keep talking even when they can’t
- Be aware that your mood and actions affect the person with memory loss
10 tips for effective communication with a person with dementia

- Never Argue .................................. Agree
- Never Reason .................................... Divert
- Never Shame ........................................ Distract
- Never Lecture ..................................... Reassure
- Never Remember .................................. Reminisce
- Never Say “I told you so” .................... Repeat
- Never say “You can’t” ......................... Say “Do what you can”
- Never Command or Demand ............. Ask or Model
- Never Condescend ......................... Encourage or Praise
- Never Force ........................................ Reinforce

CHAPTER 4

Understanding Behaviors Related to Dementia
Understanding behaviors (the way people behave or act)

Dementia affects parts of the brain that control a person's ability to control their own responses. It’s not something they are doing on purpose. Dementia can cause a person to act in different ways. These behaviors can be different for each person throughout the stages of the disease.

Common changes in the person’s personality and behavior may include:

- Getting upset, worried and angry more easily
- Acting depressed or not interested in things
- Hiding things or believing other people are hiding things
- Wandering away from the home
- Pacing
- Hitting, kicking, or biting
- Misunderstanding or confusion of what they see or what they hear
- May become more focused on sex
- May stop bathing
- May want to wear the same clothes every day

Some reasons why these behaviors may happen:

- There are changes taking place in the brain
- They are not understanding what is happening around them
- The task is too hard
- They are in pain
- They have trouble communicating
What can behaviors be linked to?

The environment

• The environment is too big or cluttered. This can be confusing to the person
• There is too much noise, which increases the stress for the person
• There is a lack of structure in their daily routine

Completing a task

• The task may be too hard; you can use cueing and assistance to help the person complete the task
• The task may have too many steps. Try breaking down the task into one step at a time

Physical health

• The effects of a medication on the person
• It could be they have impaired vision or hearing
• It could be related to an acute illness (UTI, GI bug, fever)
• The effects of another chronic illness (CHF, diabetes, angina, COPD)
• It could be related to dehydration
• It could be related to constipation
• The effects of fatigue
• They may have physical discomfort such as hunger, feeling too hot or too cold
How to manage personality and behavior problems

• Rule out medical causes (especially if there is a quick change in behavior)
• Pay attention to what the person is saying both verbally and non-verbally
• Validate their feelings and try to distract them
• Refocus their attention whenever possible
• Promote a sense of feeling safe and secure and offer reassurance often
• If the person with dementia is upset, sometimes saying you’re sorry may help
• Understand their behavior is how they communicate
  – For example: if they hit you, you may have startled them or you may be too physically close to them
  – Try not to take it personally, they are acting on instinct and are trying to feel in control
## Common behaviors that occur with dementia and what to do

<table>
<thead>
<tr>
<th>Behavior</th>
<th>Definition</th>
<th>Causes</th>
<th>What to do</th>
</tr>
</thead>
</table>
| **Suspicion** | Occurs when the person with dementia sees things in new or unusual ways. This may be due to a misunderstanding of what they see or hear and is caused by the brain disease | • Not including person with dementia in conversation or talking about person with dementia like they are not there  
• Poor vision or hearing  
• Too much stimulation causing a misunderstanding of what is happening around them | • Don’t argue, reason or explain  
• Offer a simple answer sharing your thoughts  
• Switch the focus to another activity or ask them to help with something  
• Duplicate any lost items if the person is often searching for a specific item  
• Listen to what is upsetting the person and accept their reality, validate this feeling, be reassuring and let them know you care |
| **Aggression** | At times a person with dementia is unable to recognize or know how to communicate their needs | • Poor impulse control due to the disease process  
• Frustration when trying to do something they cannot do anymore  
• Overstimulation  
• Discomfort (pain, thirst, hunger)  
• Response to a caregiver’s stress  
• Feeling scared and someone being in their personal space | • Know what the person likes, dislikes, and their social history  
• Use calming tactics such as an apology, a smile, offer a snack or to walk with them  
• If nothing works, leave them alone until they have calmed down |
| **Confusion** | A person with dementia may not recognize familiar people, places or things and may forget the purpose of common items  
“Sundowning” is a group of symptoms that may occur at the end of the day and into the night and causes increased confusion | • A change in living arrangements  
• A different daily routine  
• Medical reasons such as an infection (UTI) or low blood sugar  
• Delirium  
• Feeling tired  
• Getting day and night mixed up  
• Difficulty separating reality from dreams | • Stay calm, do not take it personally  
• Respond with simple details  
• Show photos or other reminders  
• Offer corrections as suggestions (“I think he is your brother Sam.”)  
• Try to keep the same routine day to day |
| **Repetition** | When the person with dementia does or says something over and over again, they may be looking for comfort, security, or something familiar | • Memory loss  
• Not knowing what is happening or a separation from loved one  
• Not able to express an emotion such as fear, insecurity, and anger | • Focus on the person’s feeling and not the behavior, offer reassurance and try to distract the person with a favorite activity  
• Be calm when answering repeated questions; be patient |
<table>
<thead>
<tr>
<th>Behavior</th>
<th>Definition</th>
<th>Causes</th>
<th>What to do</th>
</tr>
</thead>
</table>
| Feeling Anxious or Agitated    | A person with dementia often feels very anxious and becomes tense or restless. It becomes hard to let go of their fears and needs and to rely on a caregiver for their care and direction. | • Changes in environment  
• Travel  
• Hospitalization  
• Moving to a new place  
• Changes in the caregiver  
• Fear and fatigue from trying to make sense out of a confusing world | • Try to understand what is causing the feeling  
• Create a calm environment  
• Provide reassurance  
• Begin a new activity that might help the person relax such as music, art, taking a walk  
• Monitor their comfort; could their feelings be related to hunger, thirst, or pain |
| Inappropriate Sexual Behavior  | Inappropriate sexual behavior (ISB) may occur in a person with dementia and includes three types of behaviors:  
  Sexual talk (obscene, threatening, or abusive language)  
  Sexual acts (touching, exposing, public masturbation, fondling)  
  Implied sexual acts (public pornography, requesting unnecessary genital care) | What could cause ISB?  
• Need to feel intimacy  
• Need for comfort  
• Feeling bored  
• Uncomfortable  
• Need to use the toilet  
• Infection | Strategies for managing  
• Stay calm and be patient.  
• Gently but firmly tell the person that the behavior is inappropriate. Say “No, stop I don’t like that.” “Stop that’s not right” or just say “Stop.”  
• Distract them and redirect, turn on the TV, music, go for a walk, offer a snack.  
• Move the person to another location. This takes them away from what may be triggering their behavior. Always be mindful of the persons location.  
• If nothing else works, startle them a bit by raising your voice and firmly saying “No!”  
• Identify triggers to prevent ISB. Document the behavior. Keep a behavioral log to assist in figuring out the triggers.  
• Keep them occupied with different types of engaging activities (fidget activities, stuffed animal, doll).  
• Boredom can also cause sexual behavior. Keep your older adult happily occupied with different types of engaging  
• Use adaptive clothing (clothing that may be hard to get on and off).  
• A discussion with a physician may be helpful to determine the best plan to address ISB. |
Responding to a challenging behavior
Dealing with challenging behaviors is a process. Try to think of it as a puzzle instead of a problem. This will help reduce the negativity of the situation. There are no quick solutions to manage challenging behaviors. Patience and creativity are helpful traits when caring for a person with dementia.

Things to consider
- We can accept the behavior and provide ways to help the person by offering reassurance or redirection
- We can change our approach through learning new responses
- We can adjust our expectations
- We can remind ourselves the person with dementia is doing the best they can
- Look at the person’s behavior as communication; I want, I need, I feel.
- Avoid using labels as the label may hide the real problem (i.e. aggressive, stubborn, wandering, socially inappropriate)
- We can use medications if needed for safety or to minimize extreme behaviors

Solutions to behavior problems
- Observe the behavior objectively; do not REACT
- Empathize “I guess I might feel the same way you do.”
- Listen
- Label the emotion.
- Reframe by asking yourself if the behavior is against you or a response to a situation

What could the misbehavior mean?
- A feeling of “I need attention” could result in an angry outburst or the person being passive
- A feeling of “I don’t want to fail” could result in the person refusing to participate
- A feeling of “I want to be in control” could result in behavior that is disruptive, yelling, and criticizing
- A feeling of “I want to get back at you” could result in the person being rude or retaliation

Resource: Matters of the Mind and Heart, Beverly L. Moore, RN CS
Catastrophic Reaction

Some people with dementia experience what is called a catastrophic reaction. This type of reaction or behavior occurs in a person with dementia when the situation overwhelms their ability to think or respond appropriately. It is a sudden or drastic outburst or change in the person’s mood or behavior.

Examples of catastrophic reactions are:

- Physical reaction such as hitting, kicking or pulling hair
- Emotional reaction such as shouting, screaming or crying uncontrollably
- Increased tension and stubbornness

Why do catastrophic reactions occur in dementia?

- The person feels lost or afraid
- There are too many people around or being in a new place
- The person is being asked too many questions, especially the question “Why?”
- The person is being yelled at by the caregiver
- The person senses that the caregiver is upset

The most common cause for a person with dementia to have a catastrophic reaction is when they are being helped with personal care tasks. Catastrophic reactions commonly occur at times of change, such as meals, especially dinner, change of caregivers, and bedtime.
How can a catastrophic reaction be prevented?
• Approach the person from the front, instead of the back or side to prevent startling them
• As the care partner try to appear calm and relaxed
• Know what the person likes and doesn’t like
• Explain clearly what you would like to have the person do before attempting to do it. For example say: “Dinner’s ready, let’s walk to the table together.”
• Give directions one step at a time
• Don’t criticize or argue
• Keep the daily routines structured and the same day to day

How should a care partner respond to a catastrophic reaction?
• Give the person physical space
• Don’t use restraint or force
• Be respectful, and don’t talk down to the person with dementia
• Use the person’s name
• Allow the person extra time to calm down
• Reassure the person
• Redirect the person’s attention to focus on something else
• If a catastrophic reaction is unusual for this person, consider the possibility that the person may have a health issue and discuss it with the person’s doctor
Wandering
A person with dementia may not remember where they live. The research has shown that 6 out of 10 people with dementia will wander away from home and become lost. This can happen to the most careful caregivers and is a huge safety concern.

Behavioral signs that a person may wander and strategies to stop wandering:

• The person tries or wants to “go home” even when they are at home
  What you can do: Try to redirect to another room for a snack or activity

• The person tries or wants to “go to work” or other former obligation
  What you can do: Use a “Fiblet” (For example, reassure him that today is a day off from work)

• Person is restless or pacing
  What you can do: Offer exercise or other meaningful activity throughout the day

• Person appears nervous or anxious
  What you can do: Reduce noise level or other distractions to reduce this feeling.
Possible things that may trigger wandering

- A certain time of day or any clue before attempting to wander
- Anything new in the person’s life (a recent move, new medication)
- The person may be having a hallucination
- If the person has a route that they usually take you can use this route for a daily walk

How to reduce the risk of wandering

- Keep to a daily routine that includes meaningful activity, and enough physical exercise that will distract the person from wandering and provide an outlet for energy
- Place a slide bolt on the top or the bottom of the exit door
- Use child-safe doorknob covers
- Attach a bell or electronic device that rings when the door opens
- Keep hats, coats, keys away from the exit door and out of sight
- Try putting a “stop” sign on the inside of exit doors
- Disguise exit doors at night with a curtain

If there are concerns about the person with dementia wandering, consider purchasing location tracking device or utilizing the Medic Alert Safe Return System
Basic human needs and the language of behavior

People with dementia exhibit certain behaviors when their basic human needs are not met. In the chart below, Professor Tom Kitwood, author of the book Dementia Reconsidered, describes the five basic human needs that are not met for someone with dementia, their typical behaviors and interventions to help meet these needs. As a care partner, our goal is to interpret the language of behavior and do our best to meet that need.

<table>
<thead>
<tr>
<th>Basic Need Not Met</th>
<th>Typical Behaviors</th>
<th>Things to do</th>
</tr>
</thead>
</table>
| **Inclusion** – the need to be part of a larger group | Hovering, clinging, intrusiveness and shadowing | • Involve in a group activity or program  
• Invite her to stand with you while you are speaking to someone else |
| **Occupation** – the need to feel meaningful by exercising abilities and strengths | Boredom, wandering, resisting care, increased agitation | • Empower her to do as much as possible  
• Engage in familiar tasks like household chores, cooking, cutting coupons or sorting things |
| **Attachment** – the need to bond with another person | Fear, paranoia, delusions, exit-seeking | • Have consistent care partners  
Provide opportunities for socialization to help the person with dementia feel connected to others  
• Encourage and help with family gatherings. |
| **Comfort** – the need to feel tenderness, closeness, warmth and security | Anxiety, fear, panic, anger | • Hugs, hand holding, scratching someone’s back, saying, “I love you” |
| **Identity** – The need to have one’s uniqueness affirmed by others | Depression, withdrawal, isolation, distrust | • Know their life story. Use good communication techniques. Make eye contact.  
• Use her name often. Introduce her to others telling others something important about her (“Hi, this is Sadie, she has 10 children.”) |
CHAPTER 5

Safety
General safety concerns for people with dementia

People with dementia become increasingly unable to take care of themselves. As a care partner, you face the ongoing challenge of adapting to each change in the person’s behavior and functioning.

Think Prevention

Checking the safety of your home will help you take control of some of the potential problems that may create hazardous situations.

Adapt the environment

It is more effective to change the environment than to change most behaviors. You can change the environment to decrease the hazards and stressors that accompany these behavioral and functional changes.

Minimize danger

A safe environment can be a less restrictive environment where the person with dementia can experience increased security and more mobility.

Safety in the physical environment

As the disease progresses the five senses change and the physical environment needs to be modified.

Impairment of the Senses:

Vision

- Create color contrast between floors and walls to help the person see depth
- Use dishes and placemats in contrasting colors to identify the food. Such as a bright colored plate on a white placement
- Mark the edges of steps with brightly colored strips of tape to outline changes in elevation
- Place brightly colored signs or simple pictures on doors to important rooms for easier identification
- Be aware that a small pet that blends in with the floor or lies in walkways may be a hazard
Smell

• A loss of or decrease in the sense of smell is common in dementia
• Install smoke detectors and check them frequently. The person with dementia may not smell smoke or may not associate it with danger
• Keep refrigerators clear of spoiled foods

Touch

• People with dementia may experience loss of sensation or may no longer be able to interpret feelings of heat, cold or discomfort
• Adjust water heaters to 120 degrees to avoid scalding water
• Color code separate water faucet handles, with red for hot and blue for cold
• Place a sign over the oven, coffee maker, toaster, crock-pot, iron and other potentially hot appliance that says DO NOT TOUCH or STOP! VERY HOT
• Use a thermometer to tell you whether the water in the bathtub is too hot or too cold
• Remove furniture with sharp corners or pad them to reduce potential for injury

Taste

• Individuals with dementia may lose taste sensitivity. As their judgment declines, they also may place dangerous things in their mouth. Such as Q-tips, rocks, potpourri, razor blades, batteries
• Keep all condiments such as salt, sugar, or spices away from easy access
• Remove or lock up medicine cabinet items such as toothpaste, perfume, lotions, shampoos, rubbing alcohol, or soap, which may look or smell like something edible
• Consider a childproof latch on the refrigerator, if necessary
• Keep the toll-free poison control number 1.800.222.2221 by the telephone
• Keep pet litter boxes away from the individual with dementia
Hearing

- Individuals with dementia may have normal hearing, but they may lose their ability to understand what they hear correctly.
- Avoid excess noise in the home such as having the stereo and the TV on at the same time.
- Be sensitive to the amount of noise going on outside, and close windows or doors, if necessary.
- Avoid large gatherings of people in the home if the person with dementia shows signs of being uncomfortable in crowds.
- Check hearing aid batteries.
Home Safety: Room to Room

Front entrance

• Remove all scatter rugs and throw rugs
• Use textured strips or nonskid wax on hard wood floors to prevent slipping

Kitchen

• Install childproof door latches on storage cabinets. Lock away ALL household cleaning products, matches, knives, scissors, blades, small appliances, and anything valuable
• If medications (prescription or over the counter) are kept in the kitchen, store them in a locked cabinet
• Remove all scatter rugs and pads from the floor
• Remove knobs from the stove, or install an automatic shut off switch
• Keep a night light in the kitchen
• Remove or secure the “junk drawer.”
• Remove artificial fruits or vegetables or food shaped kitchen magnets, which might appear to be food
• Insert a drain trap in the kitchen sink to catch anything that is put down the drain
• Consider disconnecting the garbage disposal
Bedroom

- Assume the reasons a person with dementia might get out of bed, such as hunger, thirst or need to go to the bathroom
- Use a night light
- Use an intercom device to alert you to any noises indicating a fall or need for help
- Remove scatter rugs
- Remove portable heaters
- Be cautious when using electric mattress pads, electric blankets and heating pads, all of which can cause burns and fires
- If the individual with dementia is at risk of falling out of bed, place mats next to the bed, as long as they do not create a greater risk of accident
- Use transfer or mobility aids

Living Room

- Clear all walk areas of electrical cords
- Remove scatter rugs or throw rugs
- Place decals at eye level on sliding glass doors, picture windows or furniture with large glass panels to identify the glass pane
- Do not leave the person with dementia alone with an open fire. Consider alternative heating sources. Remove matches and cigarette lighters
- Keep the remote controls for the television, DVD player, and stereo system out of sight

Bathroom

- DO NOT leave a person with advanced dementia alone in the bathroom
- Remove the lock from the bathroom door to prevent the person with dementia from getting locked in
- Place nonskid adhesive strips, decals, or mats in the tub and shower
- Use an extended toilet seat with handrails, or install grab bars beside the toilet
- Install grab bars in the tub/shower. A grab bar in contrasting color to the wall is easier to see
• Use a plastic shower stool or bench and a hand-held showerhead to make bathing easier
• In the shower, tub, and sink, use a single faucet that mixes hot and cold water to avoid burns
• Adjust the water heater to 120 degrees to avoid scalding tap water
• Insert drain traps in sinks to catch small items that can be lost or flushed down the drain
• Store medications in a locked cabinet
• Remove cleaning products from under the sink, or lock them away
• Remove small electrical appliances from the bathroom
• Cover electrical outlets

**Laundry Room**

• Keep the door to the laundry room locked if possible
• Lock all laundry products in a cabinet
• Remove large knobs from the washer and dryer if the person with dementia meddles with machinery
• Close and latch the doors and lids to the washer and dryer to prevent objects from being placed in the machines

**Garage/Shed/Basement**

• Lock access to all garages, sheds, and basements if possible
• Inside a garage or shed, keep all potentially dangerous items, such as tools, tackle, machines and sporting equipment, either locked away in cabinets or in appropriate boxes or cases
• Secure and lock all motor vehicles and keep them out of sight if possible
• Keep all toxic materials, such as paint, fertilizers, gasoline, or cleaning supplies, out of view
• If a person with dementia is permitted in a garage, shed, or basement, make sure the area is well lit and that stairs have a handrail and are safe to walk up and down
Outside the Home

- Keep steps sturdy and textured to prevent falls in wet or icy weather
- Mark the edges of steps with bright or reflective tape
- Consider a ramp with handrails into the home rather than steps
- Eliminate uneven surfaces or walkways, hoses, or other objects that may cause a person to trip or fall
- Restrict access to a swimming pool by fencing off with a locked gate
- Patio area, remove the fuel source and fire starters from any grills when not in use
- Make sure outside lighting is adequate. Light sensors that turn on lights automatically as you approach the house may be useful
- Prune bushes and foliage well away from walkways or doorways
- Consider a “NO SOLICITING” sign for the front door

Home safety helpful hints

- Display emergency numbers and your home address near ALL telephones
- Install smoke alarms and carbon monoxide detectors near all sleeping areas and check their function and batteries on a regular basis
- Install secure locks on all outside doors and windows
- Hide a spare house key outside in case the individual with dementia locks you out of the house
- Avoid the use of extension cords. Tack extension cords to the baseboards of a room to avoid tripping
- Cover unused outlets with child-proof plugs
- Place red tape around floors, radiators, and other heating devices to deter the individual with dementia from standing on or touching a hot surface
- Check all rooms for acceptable lighting
- Stairways should have at least one handrail that extends beyond the first and last step
- Keep all medications (prescriptions and over the counter) locked
- Avoid clutter. Keep all walk areas free of furniture
Keep plastic bags out of reach. An individual with dementia may choke or suffocate

Remove all guns or other weapons from the home

Lock all power tools and machinery in the garage, workroom or basement

Remove all poisonous plants from the home

Is it safe to leave the person with dementia home alone?

Each person is different; consider the following when making that decision.

Does the person with dementia:

• Become confused or unpredictable under stress
• Recognize a dangerous situation
• Know how to use the telephone in an emergency
• Know how to get help
• Stay content within the home
• Wander and become disoriented
• Show signs of agitation, depression, or withdrawal when left alone for any period of time
• Attempt to do former interests or hobbies that might now require supervision, such as cooking, lawn care, driving, snow removal or use of tools

As dementia progresses, these questions will need ongoing evaluation.
Driving Safety

Addressing driving concerns is a very sensitive topic and can cause the person with dementia to be frustrated, anxious and stressed. Taking away a person’s ability to drive takes away their feeling of freedom. A person’s self-identity may be closely connected to driving. Driving provides a sense of independence that is difficult to give up.

How does dementia impact driving?

<table>
<thead>
<tr>
<th>Concern</th>
<th>Impact on driving</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decreased or poor judgment</td>
<td>Road rage, getting lost, running lights, trouble problem solving (being re-routed because of construction and inability to change driving plan), driving the wrong way, accelerating instead of braking or braking instead of accelerating, challenges to read the gauges (warning lights, gas)</td>
</tr>
<tr>
<td>Visual spatial relations</td>
<td>Trouble reading signs, how far or how close is the car in front of you or the side of you, challenges with parking and curbs</td>
</tr>
<tr>
<td>Slow response time</td>
<td>Braking, stopping for traffic or light changes, lane changes, entering and exiting highways</td>
</tr>
<tr>
<td>Confusion to time and place</td>
<td>Getting lost while driving - even to familiar places, forgetting where the car is parked, trouble following directions, not recognizing vehicle in large parking lot</td>
</tr>
</tbody>
</table>

When to have the conversation about driving?

Ideally it is best to have the conversation when the person with dementia can be involved with planning. It’s ok to have the conversation with the person over time.

Realistically the conversation doesn’t happen for most families until there has been confusion on the road, challenges with parking or direction, getting lost, unexplained damage to vehicles, and challenges pumping gas.

How to have the conversation?

- Relate the need to stop driving as a complication of the disease not that the person did something wrong
- Focus on the disease not the individual as the reason for driving restrictions
Focus on the impact driving could have on others, i.e. grandchildren, school children, other loved ones

- I know you would feel awful if you or someone else got hurt while you were driving
- It’s better to be safe than sorry.
- It would be my pleasure to drive you

If possible shoulder the blame with another professional (Police Department, Department of Motor Vehicle Department, Physician)

We want to limit their driving NOT their living, discuss alternate transportation options to ensure they can attend activities that keep them engaged

**When the conversation doesn’t go well**

**Consider:**

- Removing the triggers (car and the keys)
  - Donate the car
  - The car is at the mechanic
  - Someone is borrowing the car
- Disable the car (remove spark plugs, battery) and advise the mechanic what you have done and why
- Provide a fake set of keys

Ensure that all care partners and family involved is informed of plan related to driving concerns and restrictions

A good resource for additional information on driving and dementia is a publication from The Hartford called *At The Crossroads Family Conversation About Alzheimer’s Disease, Dementia and Driving*

Website:
https://s0.hfdstatic.com/sites/the_hartford/files/cmme-crossroads.pdf
CHAPTER 6

Activities
Benefits of activities

Activities are important for a person with dementia. They provide structure, purpose and meaning.

Activities are the things we do, such as getting dressed, doing tasks, playing cards, or paying bills. They can be active or passive, done alone or with others. A person with memory loss doesn’t have to give up the activities that he or she loves. Many activities can be adapted to the person’s ability. Activities reduce confusion, restlessness, apathy, and psychiatric signs such as delusions, hallucinations and paranoia.

People with dementia may:
- Say no to activities
- Need activities to remain active
- Have a hard time with large groups of people

As the disease progresses:
- Keep in mind what activities the person can do and likes to do
- Identify if the person can start an activity without help
- Be aware of physical challenges (vision, hearing)
- Focus on fun
- Encourage them to take part in daily life
- Consider tasks that are familiar (housekeeping, office work, yard work)
- Think about the time of day. Does the person do better in the morning or afternoon?
Tips to help make an activity successful for the individual with dementia

• Make it simple – an activity should not need new learning
• It should have minimal steps to complete
• Make it personal – an activity should be meaningful to the person
• Stress-free – the activity should not be tiring for the person
• Successful – the activity should be focused around personal needs and life

Why encourage someone to participate in activities?

• It promotes a time to experience positive emotions
• It promotes a sense of purpose
• It promotes a sense of belonging and self-esteem
• It promotes the highest level of function

Activities can:

• Tap into past interest or skills (cards, house cleaning, arts and crafts, music, and exercise)
• Be related to their past work history or experience
• Be as simple as spending time talking or enjoying a snack together

Activities will need to be initiated by others as getting started is the most difficult task for a person with dementia.

The purpose of an activity is not in what is done, but in the doing of the activity. The process is more important than the end result.

*Matters of the Mind and the Heart by Beverly L. Moore, RN, CS, 2000*
Planning the day
A planned day allows the person with dementia to spend time on activities that provide meaning and enjoyment.

Before making a plan, consider:
- What the person likes and dislikes
- What the person’s strengths, skills and interests are
- How the person used to spend his or her day
- What times of the day the person is at their best
- Allow plenty of time for meals, washing and dressing
- The person’s regular times for getting up and going to bed

Keep in mind as the memory loss continues, the abilities of a person will change.

Writing the plan
- What activities work best? What activities don’t work well? Keep in mind that the success of an activity can vary from day to day
- Are there times during the day when there is too much going on or too little to do?
- Are spontaneous activities enjoyable and easily completed?

Don’t be concerned about filling every minute with an activity.
The person with memory loss needs a balance of activity and rest.

| Morning          | Wash up, brush teeth, get dressed |
|                 | Make and eat breakfast           |
|                 | Have coffee, make conversation   |
|                 | Discuss the paper, try a craft project, talk about old photos |
|                 | Take a break, have some quiet time |
|                 | Do some house work               |
|                 | Take a walk, play an active game |

| Afternoon        | Make and eat lunch, read mail, wash dishes |
|                 | Listen to music, do crossword puzzles, watch TV |
|                 | Take a walk or visit a friend |

| Evening          | Make and eat dinner, clean kitchen |
|                 | Talk about things from the past over coffee and dessert |
|                 | Play cards, watch a movie, give a massage |
|                 | Take a bath, get ready for bed, read to them |

50 Activities
to do with an individual who has dementia

1. Clip coupons
2. Play favorite music and sing together
3. Rake leaves
4. Take a ride
5. Bake cookies
6. Take photos of the person and make a collage
7. Toss a ball
8. Sweep the patio
9. Blow bubbles
10. Take a walk
11. Color pictures
12. Make holiday cards
13. Do a simple puzzle
14. Sort coins
15. Pop popcorn
16. Read from a magazine
17. Model with play dough
18. Ask someone with a baby to visit
19. Weed the flower garden
20. Have an afternoon tea
21. Dye eggs
22. Give a manicure
23. Wash silverware and put away
24. Make a fresh fruit salad
25. Play dominoes
26. Play a musical instrument
27. Put birdseed out for the birds
28. Make a frame out of Popsicle sticks
29. Make homemade applesauce
30. Read classic short stories
31. Invite a neighbor or friend with a calm pet to visit
32. Look at family photos
33. Roll yarn into a ball
34. Visit a family member
35. Eat a picnic lunch outside
36. Wash windows together
37. Ask the person about his first car
38. String cereal to hang outside for birds
39. Reminisce about the first day of school
40. Fold laundry or towels
41. Match a basket of socks
42. Cut pictures out of magazines or cards
43. Finger paint
44. Interview the person about his life
45. Remember great inventions
46. Recite nursery rhymes
47. Ask the person about his favorite pet
48. Pick flowers
49. Finish famous sayings
50. Create a small indoor garden in a box
<table>
<thead>
<tr>
<th><strong>Adult Day Centers</strong></th>
<th>Adult Day Centers offer people with memory loss the opportunity to be social and to participate in activities in a safe environment</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Home Health Care</strong></td>
<td>Home health care includes a wide range of services provided in the home, <em>(homemaking, personal care, companion, lifeline)</em> rather than in a facility. It can allow a person with memory loss to stay in his or her own home and can also help give the caregiver a break.</td>
</tr>
<tr>
<td><strong>Outpatient Rehabilitation</strong></td>
<td>Outpatient rehabilitation or outpatient rehab is a form of rehabilitation therapy which can include: physical therapy, occupational therapy, speech and language therapy, in which patients travel to the facility specifically to participate in rehab treatments. Once the treatment session is completed they return home.</td>
</tr>
</tbody>
</table>

## Community Care Options

| **Assisted Living Facility** | Assisted living bridges the gap between living independently and living in a nursing home. Assisted living facilities offer housing, meals, supportive services and health care. Assisted living residences generally provide 24-hour staff, recreational activities, housekeeping, laundry and transportation. Residents may choose which services they receive from the facility such as help with bathing, dressing, and eating or medication reminders. Costs vary depending on the services provided |
| **Skilled Nursing Facility** | A skilled nursing facility provides round-the-clock care and long-term medical treatment. Most nursing homes have services and staff to address issues such as nutrition, care planning, recreation and medical care. |
| **Continuing Care Retirement Communities (CCRC)** | CCRCs provide different levels of care (independent, assisted living, Skilled Nursing Facility) based on individual needs. A resident is able to move throughout the different levels of care within the community. |
Residential Care Options

Choosing a care facility
When you visit a residential care facility, ask to see the latest report from the state and the Special Care Unit Disclosure form. The facility is required to provide these. The report and the disclosure form can give you a picture of the facility's services.

• Visit the facilities at different times of the day, including at mealtimes
• Ask how many rooms are available, the cost and what insurance can be used. Think about placing your name on a waiting list even if you are not ready to make a decision about a move
• If you will be paying privately for the facility, ask what happens if the person with memory loss runs out of money. Some facilities will accept Medicaid; others may not
• When making a decision on a care facility, plan to visit and compare at least three facilities
## Care facility checklist

<table>
<thead>
<tr>
<th>Family Involvement</th>
<th>Can families communicate with staff about concerns and who in the facility should the family talk to about concerns?</th>
</tr>
</thead>
</table>
| Nursing facility staff | Can the staff assist with personal care and address all medical needs?  
|                      | Does the staff know the likes and dislikes and have a good social history of person with memory loss so that care provided meets the individual's needs and interests?  
|                      | Is the staff educated on caring for someone with memory loss/dementia? |
| Programs and Services | Ask to see the activities calendar  
|                      | Are activities available on the weekends and during evening time?  
|                      | Are activities designed to meet the like/dislikes of person with memory loss?  
|                      | Is transportation available for doctor's appointments? |
| Residents (person living in the facility) | Do residents appear comfortable, relaxed and involved in activities?  
|                      | Does indoor space allow for movement and promote independence?  
|                      | Are indoor and outdoor areas safe and secure?  
|                      | Is the facility easy to get around?  
|                      | Is there a family visiting area?  
|                      | Are residents' rooms clean?  
|                      | Can residents bring personal items with them, such as photos, blanket/sheets, chair? |
| Meals | Are there regular meal and snack times?  
|       | Is dining room pleasant?  
|       | Are family and friends able to join at mealtime?  
|       | Does the staff pay attention to make sure residents are getting enough food, drink and help with meals as needed?  
|       | Are special diets provided?  
|       | Are there few distractions during meals (example: noisy TV or music)? |
| Rules | Can family and friends participate in person's care and care plan meetings?  
|       | Do visiting hours work for the family?  
|       | Has discharge policy been discussed? |

How You Can Partner With Rehabilitation

As dementia affects an individual’s cognitive functions, physical activity, and self-care tasks; it is beneficial for those with Dementia to explore treatments provided by physical, occupational and speech therapies to address symptoms, help maintain independence, and improve quality of life. Incorporating therapy interventions early is crucial; however therapy can address all stages of Dementia.

Rehabilitation Options

<table>

Physical Therapy can help with:

- Maximize mobility, strength and balance to maintain current abilities and slow decline
- Reduce risk of falls
- Identify best ability to increase sense of purpose and decrease frustration with everyday tasks
- Identify approaches to simplify a task including use of familiar tools/equipment and home modifications
- Identify what will motivate the individual to engage in mobility tasks
- Care partner education to assist with establishing a routine, setting appropriate expectations and providing opportunities for participation in every day tasks
Speech and Language Therapy can help with:

- Obtain baseline measures of cognitive-communication functioning to monitor status over time and utilize patient’s strengths to maximize abilities
- Modify the environment to support communication
- Use memory aids or visual cues in the form of pictures or labeling in a meaningful way to support and promote independence. For example, if the person can’t remember where the socks are, put a picture of socks on the sock drawer. This is a visual aid to help the person with dementia be successful in completing the task of putting on their socks
- Assess swallowing abilities and provide recommendations and options for safe swallowing and healthy diet
- Provide care partner support and training

Occupational Therapy can help with:

- Educate the person with dementia and their care partners on new ways to meet their ever changing needs
- Assist in minimizing barriers to enhance independence within the home

Emergency planning for the “What Ifs”

It is important to have a plan in case of care partner illness, disability, or death. Who will take care of your loved one with dementia if something happens to you?

Things to put in place:

- Speak to a lawyer regarding a living trust, durable power of attorney for health care and finances, and other estate planning tools
- Talk with family about who will take responsibility for your family member with dementia
- Keep a notebook for the person who will taking over the care partner role. In the notebook include:
  - Complete “Introduction to my life tool” (pages 65-67)
  - Emergency phone numbers
  - Present behavior concerns and likely solutions
  - Ways to calm the individual with dementia
  - What help is needed with toileting, feeding, or grooming
  - The person’s favorite things to do and to eat
- Visit residential care facilities and get on the waiting lists in the event this type of care is needed in the future
CHAPTER 8

I’m a Care Partner, now what?
Care partner qualities
Caring for a person with a dementia is very hard and exhausting work. It has an impact on every aspect of your life. The role of the care partner is a labor of love and benefits from specific qualities and emotions.

Care partner attributes
- **Confidence** – that I feel capable for doing this
- **Validation** – that I feel valued for doing this
- **Satisfaction** – that I am doing good and feel good doing this

Care partner emotions
- Guilt might feel like beating yourself up over the decisions you make regarding your loved ones care
- Resentment might feel like the frustration you have over the unequal divide of responsibilities to help someone with dementia, it can also look like seeing others (friends, family, neighbors not have to experience this disease)
- Anger might feel like the overwhelming irritation you have on a regular basis about your situation and may even cause you direct physical harm (i.e. heart attacks, high blood pressure, headaches, etc.)
- Worry might feel like the uncertainty you feel about what’s going on, especially as you look to the future
- Loneliness might feel like the void you feel from loss of personal relationships, you do not have to be alone to feel lonely
- Grief might feel like the sadness and mourning you’re going through, and can sometimes lead to depression
Defensiveness might feel like you are being challenged for the choices you’ve made and the techniques you’ve used, even if someone has good intentions and is only trying to help you cope.

Satisfaction might feel like understanding you are doing the best you can, or a sense of pride and purpose in your role.

Empathy might feel like accepting that challenges or challenging behavior or a part of the disease progression and that the person with dementia does not have control over this.

Learn good coping skills by balancing the internal demands and stress that you put on yourself with the external demands that others may place on you.

Although you have committed to being a care partner, you will notice that it also has unintentional consequences for you. It is important to recognize these effects and come to terms with them.

**Unintentional consequences of being a care partner**

- You will notice that your social life and interactions have become limited.
- You may have an increase in emotional and physical stress.
- You may experience financial challenges.
- You may notice changes in your own health.

**What to do to help with consequences of being a care partner:**

- Be open to learn new skills.
- Become a part of a team.
- Balance demands and resources.
- Allow yourself to grieve.

**The traits to be a good dementia care partner**

- Sense of humor.
- Good eye contact.
- Enjoys being a problem solver.
- Creative.
- Patient.
- Interested in learning.
- A good communicator.
- Understands about relationship building.
- Willing to be wrong, reevaluate, and try again.
The needs of the person with dementia
• To feel secure and safe
• To feel in control
• To feel loved and to love others
• To feel included

How to build a care partner relationship
• Understand the challenges the person with dementia faces
• Be aware and respect the person’s habits and individuality
• Be aware of and respect the person’s needs
• Appreciate what the person is able to do
• Structure the day to help with the person’s challenges and support the remaining abilities

How to make the relationship positive
• Build a trusting relationship
• Anticipate the person’s needs
• Avoid rushing the person
• Use a calm voice – or be silent and wait
• Smile a lot
• Include the person in activities/decisions

How to partner with your healthcare provider
You know your loved one the best. It is important to share everything you know with the members of the healthcare team to keep your loved one safe and comfortable.
• Discuss their likes and dislikes with the healthcare team
• Discuss their strengths
• Discuss your safety concerns and solutions that have worked
• Discuss what causes your loved one to become upset
• Discuss your family member’s daily routines
• Provide a list of who to call with questions or concerns

Remember: Being a care partner is a process; it develops and changes over time. Acknowledge your need for help and avoid burnout. Provide information to healthcare providers to help care for your family member.
**Introduction to my life tool**

This helpful tool is to be completed and shared with anyone who may provide medical or social care for your loved one with dementia. It will help the people interacting with your loved one in a more meaningful way.

### Additional information you should know about me:
Positive approaches to being a care partner

In the world of dementia, “AS IS” is a good phrase to describe a mindset. An “AS IS” mindset frees family members to thoroughly enjoy their loved one…to live in the moment…to observe small details of what their loved one is doing and to be patient with their loved one.

Don’t argue a point

Arguments among family members over the care usually only raise emotions and rekindle unresolved issues or conflict. Open a discussion about the issue and allow family members to add ideas on a best way to handle it. Remember: “none of us is as smart as all of us.”

Be open to new learning

If you are seeking new information, you’ll find it. If you’re closed to new ideas, you won’t hear any. Education empowers us to feel more confident!

Is “Self” in the way?

Always challenge your thinking by asking yourself, “Why do I want this?” If the answers come back “I would be embarrassed if my mom’s clothes don’t match” or “what would people think (of me) if my husband couldn’t remember the names of those who visit him?” Think instead – what would your loved one want?
Keep your eyes on the journey ahead. Keep focused and learn what you can to help with the care needs. All persons with dementia are unique and have different needs depending on the disease process, previous education, personality, and interests.

**Grief cycle in a dementia care partner**

Grief plays a huge part in the perception of the burden of caregiving. Grief must be acknowledged and discussed to be decreased and to come to terms with the burden.

**The care partner may:**
- Deny the changes in the person
- Push person to be the “old self”
- Acknowledge the changes and express feelings about it
- Grieve with anger or sadness
- Accept and enjoy the person as they are now
- Appreciate the effort the person makes to make sense of the world

**How to heal care partner grief:**
- Accept your new reality that your loved one has dementia
- Identify the diagnoses as a loss
- Know the common symptoms of grief
- Identify that your feelings are important
- Ask for help
- Be kind to yourself
- Create room for hope
- Confront your fears
- Seek the spiritual

**Be in the moment. Live with meaning and purpose – know what really matters to you.**

*Matters of the Mind and the Heart* by Beverly L. Moore, RN, CS, 2000

*When someone you care about has Alzheimer’s* by Alan D. Wolfelt, Ph.D. and Kirby J. Duvall, M.D., 2011
Ways to stop guilt from dementia care

Being a care partner can be very rewarding; it is also hard work and can be extremely stressful. Some of the emotions that arise, such as grief and anger, are healthy responses to challenging circumstances. These emotions can be useful, helping you to move forward. But other emotions, such as guilt, can be unhelpful, leaving you feeling powerless or “stuck.”

Care partners often feel guilty, even if others are reassuring them that they are doing the best they can. Guilt is a tiring emotion. It can use energy a caregiver needs to complete other tasks.

One of the unique aspects of caring for someone with a dementia is that care partners almost always feel guilty in some way. This has been labeled as unjust guilt. The unjust guilt is usually caused by the demands of the care partner role and the expectations that you and others put on yourself. The feeling of guilt is normal however, there are ways to help reduce the unjust guilt and move through these feelings.

When feeling guilt, remember:

• Acknowledge your feelings
• Give yourself credit – You are doing the best you can in this situation
• Understand that changes in your loved one’s behavior is part of the disease
• Develop and have realistic expectations
• Change your expectations as the disease progresses
• Accept your loved one’s new behaviors and the loss of social skills
• Remember: being a care partner is about love

What to do to overcome guilt

• Identify the guilt and determine where these feelings come from
• Realize that you are not alone in feeling this way
• Find ways to develop positivity and to be more forgiving of yourself
Normal feelings and concerns care partners have that lead to feelings of guilt

- How you treated the person before the diagnosis
  You did not know the person had a dementia, causing the behaviors that upset you.

- At times you don’t like the person you are caring for
  These are normal feelings and you cannot help your feelings. However you have the ability to control how you respond.

- You would like more time for yourself
  Everyone experiences this need. It is very important for care partners to enjoy time away to stay healthy.

- You feel you should be able to manage this role with no help
  Ask yourself if your expectations are realistic? Accepting outside help benefits both the care partner and the person with dementia.

- You decide the person needs to move into a nursing facility
  Remind yourself that you have not failed your loved one and you are still needed.

Ten real-life strategies for being a dementia care partner

As care partners, we often use instinct to help us decide what to do. No one ever gave us lessons on how to relate to someone with memory loss. Unfortunately, dealing with dementia is difficult and often the right thing to do does not always work. Here is some practical advice:

1. **Being reasonable, rational and logical will just get you into trouble.**
   When someone is acting in ways that don’t make sense, we tend to carefully explain the situation, thinking this will help get the reaction we feel is appropriate. However, the change in the person with dementia’s brain doesn’t allow him or her to have the logical and rational thought process we expect. You will notice that he or she does not respond to our explanations, no matter how logical. What to do in this scenario: use straightforward, simple sentences.
2. **People with dementia do not need to be grounded in reality.**
   When someone has memory loss, they often forget important events that happened in their life such as the passing of a parent. When we remind him of this loss, we also remind him of that pain. Many times a person with dementia will state he wants to go home. When we reassure him that he is at home it often leads to an argument. Attempting to redirect him by asking him to tell you about his home. This is a technique that can calm a person with dementia.

3. **You cannot be a perfect care partner.**
   Just as there is no such thing as a perfect parent, there is no such thing as a perfect care partner. You have the right to the full range of human emotions. At times you are going to be frustrated and impatient. These feelings are normal. Learn to forgive your loved one as well as yourself is essential in the care partner journey.

4. **Therapeutic “fiblets” reduce stress.**
   We tend to be overly honest with people. However, when someone has dementia, honesty can lead to distress for both of you. Ask yourself – Does it really matter that your loved one thinks she is the volunteer at the day care center? Is it okay to tell her that the two of you are going out to lunch and then “coincidentally” stop by the doctor’s office on the way home to pick something up as a way to get her to the doctor? We are raised to speak the truth and therapeutic fiblets may cause an ethical dilemma for some caregivers, however if a truthful response causes emotional distress over and over again or a lack of medical care it is better to use a therapeutic fiblet to spare your loved one the emotional or physical pain.
5. Making agreements doesn’t work.
Your loved one has very poor short term memory. If you ask him not to do something ever again, or to remember to do something, it will soon be forgotten. They aren’t capable of this type of memory retention. For people in early stage dementia, leaving notes as reminders can sometimes help, but as the disease progresses, this will not work. Taking action, rather than talking and discussing, is usually a more successful approach. For example, getting a teakettle with an automatic “off” switch is better than warning someone of the dangers of leaving the stove on.

6. Doctors often need you to educate them.
Telling the doctor what you see at home is important. The doctor can’t tell during an examination that your loved stays up all night pacing. Sometimes doctors, too, need to deal with therapeutic fiblets to help their patients feel better. For example, telling the patient that an antidepressant is for memory rather than depression.

7. You can’t do it all. It’s ok to accept help before you get desperate.
When people offer to help, you should always say “YES.” Have a list of things people can do to help you, whether it is bringing a meal, picking up a prescription, helping trim the roses or staying with your loved one while you run an errand. It is harder to ask for help than to accept it when it is offered, so don’t wait until you “really need it” to get support.

8. It is easy to both overestimate and underestimate what your loved one can do.
It is often easier to do something for our loved ones than to let them do it for themselves. However, if we do it for them, they will lose the ability to be independent in that skill. On the other hand, if we insist individuals do something for themselves and they get frustrated, we just make our loved one’s agitated and most likely haven’t increased their abilities to perform tasks. It is a constant juggle to find the balance and that balance may shift from day to day.
9. **Tell, don’t ask.**
Asking “What would you like for dinner?” may have been a perfectly normal question at another time. But now we are asking our loved one to come up with an answer when he or she might not have the words for what they want. Saying “We are going to eat now” encourages the person to eat and doesn’t put them in the dilemma of having failed to respond.

10. **It is perfectly normal to question the diagnosis when someone has moments of lucidity.**
One of the hardest things to do is to remember that we are responding to a disease, not the person who once was. Everyone with dementia has times when they make perfect sense and can respond appropriately. We often feel like that person has been faking it or that we have been exaggerating the problem when these moments occur. We are not imagining things—they are just having one of those moments, to be treasured when they occur.
Care partner stress is the emotional and physical strain of being a care partner. Stress can affect your body, your thoughts and feelings, and your behavior.

Ten signs of care partner stress

1. Denial about the disease and its effect on the person who’s been diagnosed.
   I know Mom’s going to get better.

2. Anger at the person with dementia or others; that no effective treatments or cures currently exist; and that people don’t understand what’s going on.
   If he asks me that question one more time, I’ll scream!

3. Social withdrawal from friends and activities that once brought pleasure.
   I don’t care about getting together with the neighbors anymore.

4. Anxiety about facing another day and what the future holds.
   What happens when he or she needs more care than I can provide?

5. Depression begins to break your spirit and affects your ability to cope.
   I don’t care anymore.

6. Exhaustion makes it nearly impossible to complete necessary daily tasks.
   I’m too tired for this.

7. Sleeplessness caused by a never-ending list of concerns.
   What if she wanders out of the house or falls and hurts herself?

8. Irritability leads to moodiness and triggers negative responses and reactions.
   Leave me alone!

9. Lack of concentration makes it difficult to perform familiar tasks.
   I was so busy; I forgot we had an appointment.

10. Health problems begin to take their toll, both mentally and physically.
    I can’t remember the last time I felt really good.

If you experience several of these stress symptoms on a regular basis, consult a physician or call the Hartford HealthCare Center for Healthy Aging to help you manage the stress in your life.

Courtesy of National Alzheimer’s Association
Tips for coping/managing stress as a care partner

1. Educate yourself about the disease
   • Search out sources of information from your physician, libraries, Internet, Hartford HealthCare Center for Healthy Aging, etc.
   • Set realistic expectations for both yourself and the person with the disease based on your understanding of the disease.

2. Take care of yourself
   • To avoid “burn out,” take time for yourself
   • Attend to your own health care needs, i.e., exercise, eat right, get enough sleep, avoid use of alcohol and pills as aids to reducing stress
   • Keep your sense of humor
   • Participate in activities you enjoy
   • Reward yourself

3. Learn to let it go
   • Simplify your lifestyle to protect your time and energy for what’s most important
   • Accept that you may not be able to do things the way you once did

4. Practice stress-reduction techniques such as:
   • Deep breathing, meditation
   • Exercise
   • Listen to music

5. Ask for help
   • Present family and friends with ways in which they can assist you
   • Explore available community resources
CHAPTER 9

Legal and Financial Concerns
Get started by putting all of your information in place

Official papers
• Living Will
• Durable Power of Attorney for Healthcare and Finances
• Will

Money documents
• Bank account information
• Deeds, mortgage papers, ownership statements
• Monthly outstanding bills
• Retirement benefit summaries
• Social Security and pension income
• Stock and bond certificates

Costs you may face
• Ongoing medical treatment for dementia and other conditions
• Medical equipment
• Safety-related expenses, such as home safety changes
• Medications
• Adult day services
• In-home care services
• Assisted living facility
• Skilled nursing facility
• Insurance premiums
• Medicare and Medicaid co-pays
• Medicare Part D premium
• Legal documents
## Overview of medical, legal, and financial planning documents

<table>
<thead>
<tr>
<th>Medical Documents</th>
<th>How it is used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Living Will</td>
<td>Describes and instructs how the person wants end-of-life health care managed</td>
</tr>
<tr>
<td>Durable Power of Attorney for Health Care</td>
<td>Gives a designated person the authority to make health care decisions on behalf of the person with dementia</td>
</tr>
<tr>
<td>Do NOT Resuscitate Form</td>
<td>Instructs health care professionals not to perform CPR in case of the heart stops or breathing stops</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Legal/Financial Documents</th>
<th>How it is used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Will</td>
<td>Indicates how a person’s assets and estate will be distributed among beneficiaries after his/her death</td>
</tr>
<tr>
<td>Durable Power of Attorney for finances</td>
<td>Gives a designated person the authority to make legal/financial decisions on behalf of the person with dementia</td>
</tr>
<tr>
<td>Living Trust</td>
<td>Gives a designated person (trustee) the authority to hold and distribute property and funds for the person with dementia</td>
</tr>
<tr>
<td>Guardianship/conservatorship</td>
<td>If a person can NO longer make his or her own financial and /or health care decisions, someone else may have to become the person’s guardian (also known as a conservator in some US states). A guardian or conservator is appointed by a court to make decisions about the person’s care and property, when it finds that a person is legally incapacitated. In the case of dementia and its effect on the brain, legal incapacity refers to the person’s inability to make rational decisions about his or her care or property.</td>
